Introduction

This document provides information on the new features, enhancements and resolved issues released with:

- Protege GX web app version 1.32.0
- Protege GX extended services

All changes since the initial release are included.

Upgrading the Web App

To upgrade the Protege GX Web App and extended services, simply run the new installer and follow the prompts.

Protege GX Web App Version 1.32.0

New Features (1.32.0)

This release includes the following new features, bringing the web app closer to parity with the Protege GX web client.

More Protege GX Records

The Protege GX Web App now allows you to add, edit and view more Protege GX records. You can now manage the following in the web app:

- Area groups
- Door groups
- Elevator groups
- Floor groups
- Menu groups
- Output groups
- Calendar actions

Requires a calendar actions license.

- Roles
- Security levels
- Daylight savings

User CSV Import

You can now bulk import users into the web app using a CSV file. To import users, navigate to **Users, Manage** and click the **Import** button. Download and fill in the template, then upload the file to create the new user records.

Windows Authentication

The web app now supports Single Sign-On using Windows Authentication. To set up Windows Authentication:

- You must have an Active Directory Operator License: PRT-GX-AD-OPR
- The client computers must trust the Active Directory certificate generated by the Protege GX extended services. In a well-managed Active Directory environment using AD certificate services and group policies, this is typically already in place and no additional action is required for client computers.
- To allow an operator to log in with Active Directory, you must set their **Username** to **DOMAIN\Username** and enable the **Use Windows Authentication setting** in **Global | Operators**.

Feature Enhancements (1.32.0)

The following enhancements have been made to existing features in this release.

Users

- User records now display the **Last active** time for each user.
- You can now view and edit the **Inactivity expiry** settings under the **Advanced options**.
- If you have the **Extended Fields** tab enabled for users, you can now view and edit these fields in the web app.

Controls

- You can now edit door, area and floor schedules from the **Controls** pages.

Operators

- When an operator logs in, they can now choose to trust their current device for 14 days. This allows them to skip two-factor authentication when they sign in.
- The web app can now sign operators out automatically if they are inactive for a certain period of time. You can set the **Session idle timeout** in **System, Operator timeout**.

Issues Resolved (1.32.0)

The following issues were resolved with this release.

- Times and dates now correctly default to your browser's regional setting.
- On enterprise download server sites, the Arming Areas section in access levels now correctly only offers areas within the same controller group.
- When a large export fails to send due to no email server being configured, the web app now displays a clear error message rather than silently failing.
- Resolved an issue where opening a user record would fail if one of the user's optional fields failed to load.
